

P5 contrast — F-15 vs nominal vocabulary $|V|$ (looser than vs N_{eff})
 Spearman $\rho(\text{F-15}, |V|) = -0.57$ (vs $\rho(\text{F-15}, N_{eff}) = -0.73$; companion mechanism figure)

Same F-15 values and recipes as p5-dispersion-scatter; x-axis is nominal $|V|$ (from f15 JSON) instead of N_{eff} . Counterexamples to the $|V|$ reading: V14 $|V|=1024 \rightarrow$ F-15 0.95; V9 $|V|=536 \rightarrow$ 1.0; V3/V12 $|V|=1600 \rightarrow$ 0.12/0.16. The dispersion fit (companion figure) is tighter.
