

Q-sensitivity for top-contender recipes — V20 keeps climbing at finer quantisation

V20 (purple ★) is the only recipe whose F-2 and F-7 means improve monotonically from $Q=8$ to $Q=32$. V12/V3 plateau or regress at $Q=32$. V8 is Q -insensitive because its vocabulary is the endmember count, independent of Q . Q -sweep continues to a follow-up.
