

F-15 alignment against nominal vocabulary $|V|$
 Spearman $\rho(\text{F-15}, |V|) = -0.60$ (vs $\rho(\text{F-15}, N_{\text{eff}}) = -0.71$; companion mechanism figure)

Same F-15 values and recipes as p5-dispersion-scatter; x-axis is nominal $|V|$ (from f15 JSON) instead of N_{eff} .
 V14 ($|V| = 1024$, 16 tokens per document) scores 0.95; V2, V8 and V9 sit at 1.0 by construction of the rule;
 V3 and V12 depend on the tie order of their equal-count documents (0.03 to 0.18).
