

Cross-axis Spearman rank correlation across 114 (recipe, scene) cells
F-14 jaccard is sign-inverted so all axes are direction-aligned (higher = better).

Reading: F-2, ProdLDA and ETM form the tightest positively correlated cluster (coherent topics stay coherent under the neural backbones); F-22 correlates positively with F-7 (robust topics tend to be label-aligned). The strongest anti-correlation is F-14 (inverted) with F-18, the vocabulary-size confounder. HDP correlates only weakly with every other axis.
