

Cross-axis Spearman rank correlation across 114 (recipe, scene) cells
F-14 jaccard is sign-inverted so all axes are direction-aligned (higher = better).

Reading: F-2 / F-7 / F-22 / HDP / ProdLDA / ETM form a positively-correlated cluster — recipes with strong topic-word coherence also produce label-aligned, robust topics under multiple backbones. F-18 anti-correlates with F-2 (the vocabulary-size confounder Stambach et al. flagged). F-14 (inverted) correlates positively with F-1 / F-22 — diverse topics are more robust.
