

P5 mechanism — F-15 alignment tracks token-mass dispersion, not coherence
Spearman $\rho(\text{F-15}, N_{\text{eff}}) = -0.73$ (vs $\rho(\text{F-15}, |V|) = -0.57$; see companion figure)

$N_{\text{eff}} = 2^{H(p)}$ with p the corpus marginal token distribution, computed from data/local/wordifications/<recipe>/uniform_Q8/<scene>/doc_term.npz (matches derived corpus_marginal_entropy_bits). F-15 from data/derived/v_sweep/f15_llm_alignment/. V14 has nominal $|V|=1024$ yet $N_{\text{eff}} \approx 67 \rightarrow$ F-15 0.95, while V3/V12 ($|V|=1600$, $N_{\text{eff}} \approx 465$) collapse to 0.12/0.16: F-15 is a dispersion meter, refuting the pure $|V|$ reading.
